Title : Bulgarian Experience with Centralized Manufacture of Concrete and Solutions
Orig Pub. : Stroitelstvo, 1958, 5, No 8, 6-13
Abstract : Presented is a flow diagram together with the description of concrete manufacture at the centralized concrete plant in Sofia with a tie-in for the manufacture of a solution (T) suitable for supplying large housing construction projects. It is indicated that justification of T increases with the increase of yearly production. T also results in the necessity of mechanizing manufacturing operations. Technological and economic factors

TITLE: Chemical composition of naphtha obtained by coking of topped residue from naphthenic-aromatic Tyulenovo crude. \ 7. Individual and group composition of aromatic and naphthenic-paraffinic hydrocarbons in the 150-200C fraction

SOURCE: Sofia. Universitet. Khimicheski fakultet. Godishnik, v. 58, 1963/1964.
Sofia, 1965, 63-76

TOPIC TAGS: aromatic hydrocarbon, olefin, chemical composition, naphtha, paraffin

ABSTRACT: A combination method was used for the tentative group analysis and qualitative determination of individual hydrocarbons in a 150-200C cut of coking naphtha from Bulgarian crude; the method comprised chromatographic separation, rectification, gas chromatography, catalytic dehydrogenation, spectroscopy, and measurements of physical and chemical parameters. The presence of 36.8% naphthenic-paraffinic hydrocarbons, 38.2% olefins, and of 25% aromatics was shown. Qualitative analysis showed measurable and trace amounts of 18 and 11 aromatic and 15 and 9 cyclohexane derivatives, respectively. Relatively larger amounts of 1-methyl-3-ethylbenzene, 1,2,4- and 1,2,3-trimethylbenzene, indane, n-butylbenzene, 1,2-dimethyl-4-ethylbenzene, 1,2,4,5-tetramethylbenzene, and naphthalene were indicated by the intensity of spectroscopic

TITLE: Determination of gold in mineral raw materials by means of the neutron activation analysis

SOURCE: Chemicke zvesti, no. 9, 1964, 661-668

TOPIC TAGS: gold, analytic chemistry, silicate, radiation spectrometer, radiometer, radiation chemistry, neutron irradiation, neutron flux, neutron

Abstract [Authors' German summary, modified]: A method is presented of determining gold in samples of silicates by means of the neutron activation method. Samples were irradiated in a nuclear reactor by a flux of neutrons of $2.4 \times 10^{13} n/cm^2 \text{ sec}^{-1}$. The induced activity was measured by a 400-channel scintillation γ spectrometer or a B-2 radiometer. It is possible to determine gold in ore and non-ore raw materials up to the volume of 2.8×10^{-6} grams. Orig. art. has 2 graphs and 3 tables.

Title : Physiological Anisocytosis in Some Domestic Animals
and an Experience in Employing It in Clinical
Diagnosis

Orig Pub : Nauchni. tr. M-vo zemed. i gorite. Ser. zhivotnov"-
dstvo i vet. delo, 1957, 2, No 1, 41-48

Abstract : Anisocytosis as an indicator of blood changes in
various physiological conditions and pathological
processes is hardly utilized in veterinary practice.
In order to determine the level of anisocytosis, it
is expedient to use methods of variation statistics.
By determining the average diameter of erythrocytes,
the displacement of the variation curve of erythrocyte

Card 1/3

BULGARIA / Diseases of Farm Animals. General Problems.

R

Abs Jour : Ref Zhur - Biologiya, No 2, 1959, No. 7418

sizes to the left (microcytosis) or to the right (macrocytosis) is established. The average diameter of erythrocytes in horses amounts to 5.07 - 5.5, in cattle to 5.67 - 6.18, in sheep to 4.08 - 4.38, in goats to 3.02 - 3.29 mm. The physiological anisocytosis of horses is to be found within the limits of a square variation of 0.41 - 0.49, of cattle within 0.45 - 0.54 and of goats within 0.25 - 0.29. Higher deviations than those to be found within the limits mentioned above, should be considered as pathological anisocytosis which in a number of cases accompanies pathological conditions of the animals' organism. Thus in horses microcytosis without anisocytosis was observed when jaundice (4 cases) was present, in pleuropneumonia (17 cases) anisocytosis with a tendency to macrocytosis, and in strangles

"Effect of Selenium Dioxide on the Growth of Young Pigs"

Sofia, Veterinarna Sbirka, Vol 63, No 9, p 30

Abstract: Selenium in various forms is used extensively as a remedy in veterinary medicine. It was established in Western work that selenium increases considerably the rate at which lambs gain weight. Kr. Gerov et al. found that selenium also increases wool production of the animals. Good results were obtained by T. Venkov et al. in experiments in which selenium was administered to stunted young pigs. In experiments conducted in this instance by the authors, 0.4 ml/kg of an 0.1% alkalized selenium dioxide solution was injected every 10 days into normal, healthy pigs 1-2 mos. old. Within 30 days, a rate of growth 20% higher than that of control animals was obtained. Furthermore, the pigs treated with selenium dioxide showed a higher resistance to infection than animals in the control group.

TITLE: Concentration of uranium ores

PERIODICAL: Bányászati Lapok, no. 4, 1960, 257-264

TEXT: The article deals with the concentration of uranium ores, describing the development and the different concentration methods used in the Western countries and in the USSR. The gradual exhaustion of hydrothermal uranium ore deposits made it necessary to increase the exploitation of conglomerates and sedimentary deposits with a uranium content of only 0.1-0.5%, and to develop and introduce new profitable ore concentration methods. Emphasis is laid on the fact that uranium cannot be regarded as a metal and has no importance as a material with secondary structure such as iron and copper, but that it is a source of energy. The following methods for preparing the uranium ore for metallurgical use are known: (1) physical concentration methods and (2) chemical or hydrometallurgical methods. The selective grinding, carried out wet or dry in rod or ball mills,

Concentration of uranium ores

and used in physical concentration methods, was recently improved by flocculation chemicals used in sedimentation. The flotation method which produces basic material for hydrometallurgical concentration plants, can be used for treating sulfides and even carbonates prior to final concentration. Successful experiments were recently carried out with concentration of uranium carbonates. Due to these experiments it is expected that separation of uranium ores into ores with low carbonate content suitable for acid separation and into ores with high carbonate content suitable for the alkaline process will be possible. In the flotation of uranium ores fatty acids and salts with high valence are used as collecting reagents, since both the primary and secondary deposits of uranium belong to the group of oxide ores. These reagents have long-chain hydrocarbon radicals and chemically active electrophilic centers. The fatty acids can be used, most successfully, in processing silicate uranium ores. The unfavorable influence of the fine mud, which originates from the ore grinding and which contains uranium in large quantities, can be reduced by various emulsions

Concentration of uranium ores

as in case of fatty acids or other reagents not easily soluble in water. At present experiments are being carried out on emulsifying flotation reagents with supersonic waves. The gravitational process can successfully be used in concentrating pegmatite ores. The heavy-suspension process and the magnetic method are also widely used. The most recent method is radiometric grading which is based on the natural radioactivity of the uranium ore. This method is especially successful for ores where the uranium is not equally dispersed but is concentrated in lumps. The suitability of the radiometric method for grading can be determined by the contrast test. For the test several tons of sample ore are graded and the uranium content of each piece in the different grading class determined by radiometric analysis. This analysis is carried out with small-size grains in quantities weighing 1/2-2 kg. The contrast curve of the uranium ore, as shown in Fig. 4 and 5, can be drawn from data received from calculations. On the basis of these graphs the suitability of the radiometric method and the main production indices, such as weight, metal yield, etc., can be determined. Experience showed that the radiometric method can be used for en-

Concentration of uranium ores

riching ore grains larger than 25-50 mm. Successful experiments were recently carried out by grading grains of varied size, by using a radiometer for the automatic registering of differences in the quantity of gamma rays of the grain resulting from different grain sizes. The uranium ore is separated by radiometric separators at, or near, the mines. Such an installation consists of a conveyor belt, several meters long and 0.5-1.0-m wide, moving at a speed of 0.2-0.5 m/sec, above or below which one or more scintillation counters shielded by a lead screen against background radiation, have been installed. Previously, instead of scintillation counters Geiger counters were used. The ore is separated by the electromagnetic or pneumatic mechanism operated through an electronic relay system. The sketch of a separator operated by one radiometer is shown in Fig. 8. Fig. 9 shows a separator operated by 3 radiometers. In the USSR and also in Western countries experiments are being conducted on the use of radioactivity in concentrating non-radioactive ores, such as coals. The method used in these experiments, which employs various radioactive isotopes, is based on measuring the intensity of the ab-

D018/D105

Concentration of uranium ores

sorbed or reflected radioactive rays. The heat treatment method has been successfully used in the concentration of torbernitites. The ore containing 1% of U_3O_8 is heated at 700°C for 1 hour, then cooled in water and separated according to the size of grain, taking 1 mm as limiting value. It has been proved that the uranium content of finely-ground ore can be increased to 0.209% with a uranium yield of 90.5% and with waste containing 0.025% of uranium. According to the authors the above mentioned physical methods are only preliminary concentration methods. Concentrates suitable for metallurgical use have not yet been produced by any of the above processes. There are 10 figures and 8 tables.

B

TITLE: Comparative acute toxicity, motor uncoordinating activity, and anticonvulsive effect upon electroshock seizure of some phenylcarbamide derivatives

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 9, 1965, 883-886

TOPIC TAGS: mouse, autonomic nervous system, toxicology, systemic toxin, carbamic acid

ABSTRACT:

An earlier investigation by the author pointed out the existence of the anticonvulsive activity of five phenylcarbamide derivatives with substitutions in the nucleus (α -methoxyphenylcarbamide, α -ethoxyphenylcarbamide, α -aminophenylcarbamide, m -methoxyphenylcarbamide, α -ethoxyphenylcarbamide, and β , β -dimethylphenylcarbamide) upon electric convulsions (Compt. rend. Acad. bulg. Sci., 17, 1964, No 12, 1129). The present paper presents a more thorough investigation of the above substances upon electroshock seizure. In order to obtain a fuller assessment of the pharmacodynamics of these substances, they were further investigated for acute toxicity and for motor uncoordinating activity. The experiments were carried out on male white mice weighing 23 ± 0.10 g. The substances were administered intraperitoneally in 1 per cent starch suspensions. The anticonvulsive activities of the substances were determined by the test of the maximal electroshock seizure (J. E. P. Toman et al.,

Card 1/2

2

L 20224-66

ACC NR: AP6010333

J. Neurophysiol., 9, 1946, 231) modified for albino mice (E. A. Swinyard et al., J. Pharmacol. and Exptl. Therap., 96, 1949, 99). The criterion adopted for the anticonvulsive effect is the abolition of the tonic extension of the hind legs. The disruption of the motor coordination was determined by the ROTA-rod test (N. W. Dunham, T. S. Biya, J. Amer. Pharmac. Assoc. Sci. Ed. 46, 1957, 208). Comprehensive results are presented in the form of a table and are followed by a discussion of the relation of the toxicity of the compounds and positions of the substitution made in phenylcarbamide nucleus. This paper was presented by P. Nikolov, Corresponding Member BAN on 20 May 1965. Orig. art. has: 1 table. [JPRS]

TOPIC TAGS: toxicity, drug effect, skeletal mechanics, phenyl compound, nonmetallic organic derivative, mouse, nervous system drug

ABSTRACT: An earlier investigation pointed out the anticonvulsive action on electric, Corasol, and strychnine convulsions of certain phenylcarbamide (PC) derivatives with substitutions in the aromatic ring (V. Georgiev, O. Vassileva, Compt. rend. Acad. bulg. Sci., 17, 1964, no. 12, 1129). The present study investigated in a comparative manner the effect of these substances on Corasol convulsions. The impairment of motor coordination and acute toxicity effects were also studied. The experiments were carried out on 629 white mice and the substances used were: o-methoxyPC, m-methoxyPC, o-ethylPC, o-chlorPC, o-aminoPC, 3,4-dimethylPC, PC and MTO, as well as the anticonvulsive drugs Phenurone and Tridione, and phenobarbital sodium. Results are presented in the form of comprehensive tables. An analysis of the data shows that the substitutions within the aromatic ring of the PC (methoxy group in o- and m-positions, ethyl group in o-position, chlorine in o-position, amine group in o-position, and 2 methyl

Card 1/2

0917 22' 36

ACC NR: AP6028479

groups in positions 3 and 4) did not lead to essential changes in the PC activity towards the Corasol convulsions: the acute toxicity is slightly intensified, whereas the motor-incoordinating activity shows either a slight intensification or weakening. This paper was presented by Corresponding Member P. Nikolov on 12 August 1965. Orig. art. has: 2 tables. [Orig. art. in Eng.] [JPRS: 36,592]

"The Anticonvulsive Activity of Certain Phenylcarbamide Derivatives"
Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 3, 1966, pp 233-236

Abstract: [English article] Earlier investigations by the authors established the anticonvulsive activity of certain derivatives with substitutions in the aromatic ring (see, e.g., Compt. rend. Acad. bulg. Sci., 17, 1964, No 12, 1129). The present paper presents data obtained from a detailed pharmacological screening of the anticonvulsive effect of these derivatives with the aim of finding the connection between their chemical structure and pharmacological activities. The drugs were administered intraperitoneally in white mice of both sexes. The experiments covered the acute toxicity for 24 hours, the anticonvulsive activity after the maximal electroshock seizure test, the subcutaneous maximal Corasol (Metrazol) test (2 mg/kg), and the subcutaneous strychnine test (2 mg/kg). A comprehensive table presents the characteristics of all the PC derivatives used and the comparative toxicity and other properties. Since all the tests were carried out with one species of animals only, future investigations are planned using other kinds of animals and other methods (nonintraperitoneal) of administration of the substances. "Electroencephalographic Studies with Meta-Tolylcarbamide on Rabbits"

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 7, 1966, pp 665-668

Abstract: [English article] Earlier investigations established the pronounced anticonvulsive action (upon chemical and electric convulsions) of a number of phenylcarbamide derivatives with substitutions in the aromatic ring, outstanding among which was the derivative with a methyl group in meta-position - meta-tolylcarbamide (MTC) (see, e.g., V. Georgiev, Compt. rend. Acad. bulg. Sci. 19, 1966, No 2, 233). The present paper describes further studies of MTC by the electroencephalographic method and during acute experiments on 32 adult rabbits the author compared MTC effects with those of Phenurone. Following a brief description of the experimental procedures, the author describes 1) the effect on the spontaneous bioelectrical activity; 2) the effect on the evoked bioelectrical activity; 3) the effect on the acute epileptogenic focus; and 4) the effect on Corazol manifestations. There are 11 Bulgarian and 1 Western reference. (Manuscript received, 2 Apr 66.)
